

Toshiba TEC's efforts toward RFID solution

Shoe sales support system

Over-the-counter sale is supported through IC tag-based inventory management!

<Features>

Inventory check

- By placing a product on the trial table, not only the product information but also the stock status of related products (sizes, other colors, similar products) are displayed. By using product stock information for customer services, sales opportunities will be expanded.

Location control

- Only by holding the IC tag over the reader/writer, the location of product is shifted from the backyard to the sales floor. Location control can be performed by a simple operation.

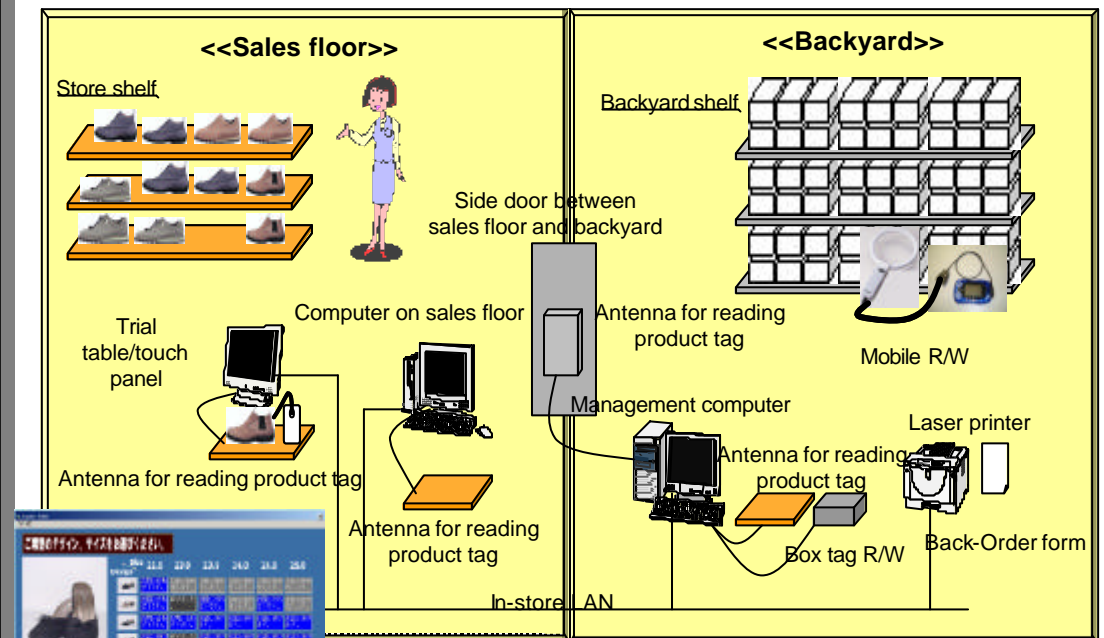

Significant reduction in inventory time

- By reading multiple IC tags with the mobile terminal, inventory time is significantly reduced. Owing to the easy inventory, the number of inventory times can be increased, resulting in more accurate inventory management.

Reduction in payment time

- By placing a product on the checkout counter, sales transaction is completed by one operation. Checkout time is shortened.

System configuration

* R/W: RF tag reader/write
